

I believe that there lies a slippery slope when it comes to eaves dropping on the citizenry. Many people believe that this bill could lead to the government reading the email of it's citizens, but it already does (through Carnivore, etc..) More and more applications are adding voice and speech functionality, the way these work is by encoding the voice into a packet and sending it to another person. This is akin to my recording my voice onto an audio tape and sending it or handing it to my friend, the government does not exert the right to listen to the contents of said tape on a whim, why should the internet be any different?
